What is it and Purpose

Senses and what's being measured
1. Agency
    a. Not measurable at this time but could be
2. Cognitive choices/behaviour
3. Why it matters:
   It's important to not lose our sense of self and making sure that constant exposure to ai doesn't distort human decision making ability.

Wellness goal/behavioural change
1. reduce over-reliance on AI systems
2. make sure that cognitive choices are still being made, without losing self-autonomy.
3. We're doing this to preserve mental and emotional well-being.
4. to prevent identitiy-crises or similar emotional distress situations (what am i apart from ai?)

Target audience

Age
1. Younger-mid demographic
    a. primary audience: 18-34 (students+early career workers)
    b. secondary audience: 35-45 (seasoned professionals managing high-decision loads and AI-heavy workload)
2. AI transition generation

Context
Primary:
1. Time pressure to use the technology
2. Fast pace
3. General AI fatigue

Secondary:
1. Too much multitasking, people overwhelmed
2. general AI fatigue
3. balance efficiency and accountability

Needs
Primary:
1. Know when convenience becomes over-reliance.
2. Keep speed benefits without losing personal voice/judgment.
3. Build confidence that outcomes still reflect their own intent.

Secondary
1. Detect trust miscalibration (blind acceptance vs unnecessary skepticism).
2. Maintain decision quality under time pressure.
3. Have auditable signals of why they accepted/rejected AI input.

Technical Aspects

3 user interface designs
1. phone
2. desktop
3. tablet

agency index: this will measure how much i'm relying on ai to make decisions. so if the index it too high, it indicates over-reliance and vice-versa. The app will flag it when the index increases above a set threshold.

Personality profile: the app will create a user profile based on the decisions you make. this will act as a secondary check along wioth agency index, to make sure that the system can alert over-reliance on ai systems.

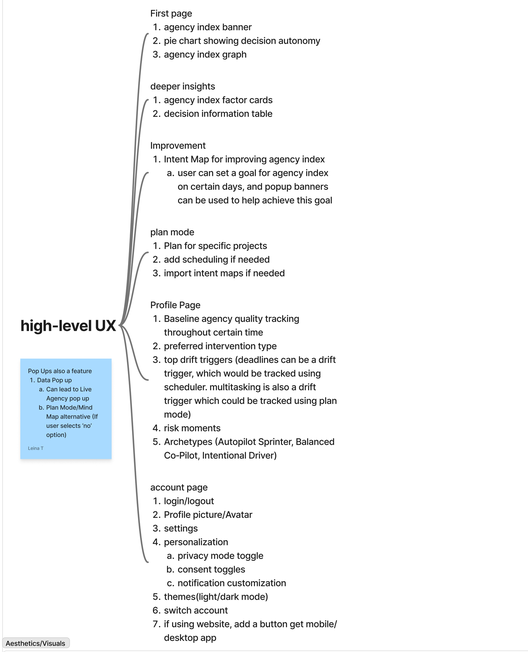
Interface in Everyday life
1. Integrated into technology with general AI system
2. Track accepted AI suggestions, override rate, regret-after-action, confidence mismatch.
3. "agency guardrails" (pause before send, alternative suggestions, manual mode windows)

User stories:
1. (students doing assignments/essays using ai)Record original intent by user before generating text by ai, so that the student can check whether their own voice is still being preserved. this makes sure that the final submission still reflects students' original idea
2. (early-career workers)the app flags when the employee accepts too many ai decisions without secondary verification/review
3. seasoned professionals
    a. Software engineering: the app will prompt after action is performed ("was this decision yours or ai's?")to make sure that the user is taking ownership of their code.
    b. team lead: weekly summary of agency index patterns to track when and what factors are leading to over-reliance on ai
    c. lawyers/consultants: whenever there are high-stake situations, the agency index threshold drops, to ensure that more manual decisions are being made.
    d. medical professionals: making sure that the agency index threshold is very low, forcing professionals to consider factors that have been missed by ai. also encourages secondary verification in the form lateral research required to make such decisions (think about writing 2 user stories for diagnostics and preventative care)
    e. high-stakes email: prompt user to review/read the email once before sending it to boss/client/professor. The system would highlight main points of the email for review, and use personality profile to ensure that your intent/voice is being conveyed.

enterprise versions allow data/profile sharing with capable users. capabilities can be configured by company

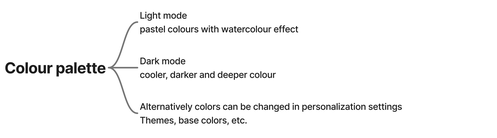
Komuda Vaidi V

High-level ui ux design

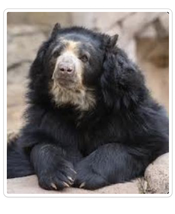


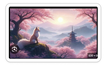
Aesthetics/Visuals

Aesthetics
1. simple colourful aesthetic
2. use colour theory to create a more calming, focus inducing interface
3. "dreamscape"



Mascot (Possible)
- Bear (leaveas/nature stuff)
- Centaur (Arrow animation)
- Pheonix (fire/ash animation)
- lynx (snow/wind)
- Octopus (bubbles)
- Kitsune (Spirit whisp/Sakura)





Visualisations

kinds of visualisations:
1. graphs
2. pie chart
3. intent map
4. plan/schedule mode
5. pop-up banners
6. agency index banner
7. infographics for profile
8. Information tables
9. agency index factor cards
10. mind map
11. login page

1. graph to show ai index across time
2. pie chart to show how many decision were autonomous in a select time period
3. mind maps to help plan out your intent during task, to encourage more autonomous decisions
4. intent maps to plan how to stop relying on ai
5. plan mode is to plan out an idea/project. the ai will tell you what to but not how to do it.
    a. additionally you can turn on schedule as an added feature in plan mode.
    b. Intent maps created for workflow can also be imported into plan mode to create plans. if the mind map is edited after, the creation of a plan, a banner should popup asking user if they want to edit/ regenerate/update plan.
6. tables in agency index reduction page to categorize the kind decisions that were made autonomously.

Yes. Your list is strong, but right now it's too broad. Make it a 3-layer system so users don't get overloaded.
pop-up banners design
1) Data Collection (Input Layer)
1. `Passive`: AI accept/edit/reject behavior, time-to-decision, revision depth, context switching.
2. `Active`: 2-tap check-ins only at key moments:
- "Was this your intent?" (`Yes / Not sure / No`)
- "Confidence" (`1–5`)
3. `Context`: deadline pressure, fatigue, task type (study/work/personal).

2) Visualization (Sense-making Layer)
1. Agency Index Timeline (primary graph): trend across day/week.
2. Decision Composition Donut (secondary): autonomous vs AI-led vs mixed for selected period.
3. Top Drift Drivers (ranked cards): "Low sleep + high deadline + high auto-accept."
4. Intent Map (replace broad mind map): only for one task/project to compare planned intent vs final output.

pop-up banners design
3) Sensory Perception/Enhancement (Action Layer)
1. Live Agency Banner: `High / Medium / Low agency` + one-line reason.
2. Interventions when low agency:
- `Pause 30s`
- `Show 2 alternatives`
- `Manual-first mode`
- `Intent reset prompt`
3. Plan Mode: AI can suggest what to consider, never final decisions by default.

How to prevent info overload
1. Default Home shows only: Agency score, 1 graph, top 2 insights, 1 action button.
2. Progressive disclosure: deeper charts only on tap.
3. Prioritize insights by `impact x confidence`.
4. Alert timing:
- Real-time only for high-risk moments.
- Daily digest for patterns.
- Weekly report for behaviour change.

future work, if time permits

1. add modes
2. accessibility support

privacy&safeguards

1. no leaderboards
2. processing on device
3. 2FA
4. user can view/delete/edit/export all data
5. encrypted storage and sync
6. lock account (like bank account freezing), in case of password leak
7. only collect behavioural signals and not raw prompts
8. Clear consent at onboarding with per-signal toggles and "Pause Tracking" anytime
9. "Stealth tracking" is explicitly disallowed in product policy and UX
10. Profile outputs are framed as coaching insights, not performance judgments.
    a. Nudges are assistive, not punitive: suggest pause, alternatives, intent reset.
11. Notification caps and cooldowns prevent anxiety/alert fatigue.
12. Manual decision override is always available.
13. If collaborative reports exist, they are anonymized and aggregated only.
14. Tool blocks features that could be used for coercion/surveillance of another person.
15. If sustained low-agency + distress signals appear, app shifts to low-pressure mode, reduces nudges, and surfaces support resources.
16. If sustained low-agency + distress signals appear, app shifts to reduces nudges, and surfaces support resources.
17. Product is explicitly not a clinical diagnostic tool; crisis messaging and escalation links are provided.

presentation contents

1. title slide
2. table of contents
3. intro (problem statement)
4. need
5. context
6. solutions
    a. target audience
    b. elevator pitch
7. product demo
    a. incorporate us and user stories in product demo
8. safeguard overview
    a. include demo of
        i. login/loout
        ii. personalization
        iii. switch account
        iv. notifications
9. expected impact
10. conclusion
